## SOLUTIONS TO CONCEPTS CHAPTER 15

- 1. v = 40 cm/sec As velocity of a wave is constant location of maximum after 5 sec  $= 40 \times 5 = 200$  cm along negative x-axis.
- 2. Given  $y = Ae^{-[(x/a)+(t/T)]^2}$ 
  - a)  $[A] = [M^{0}L^{1}T^{0}], [T] = [M^{0}L^{0}T^{1}]$  $[a] = [M^{0}L^{1}T^{0}]$
  - b) Wave speed,  $v = \lambda/T = a/T$  [Wave length  $\lambda = a$ ]
  - c) If  $y = f(t x/v) \rightarrow$  wave is traveling in positive direction and if  $y = f(t + x/v) \rightarrow$  wave is traveling in negative direction

So, y = Ae<sup>-[(x/a)+(t/T)]<sup>2</sup></sup> = Ae<sup>-(1/T)[
$$\frac{x}{a/T}+t$$
]<sup>2</sup>  
= Ae<sup>-(1/T)[ $\frac{x}{v}+t$ ]<sup>2</sup></sup></sup>

i.e.  $y = f\{t + (x / v)\}$ 

- d) Wave speed, v = a/T
  ∴ Max. of pulse at t = T is (a/T) × T = a (negative x-axis)
  Max. of pulse at t = 2T = (a/T) × 2T = 2a (along negative x-axis)
  So, the wave travels in negative x-direction.
- 3. At t = 1 sec,  $s_1 = vt = 10 \times 1 = 10$  cm
  - $t = 2 \text{ sec}, \qquad s_2 = vt = 10 \times 2 = 20 \text{ cm}$
  - t = 3 sec,  $s_3 = vt = 10 \times 3 = 30 \text{ cm}$
- 4. The pulse is given by, y = [(a<sup>3</sup>) / {(x vt)<sup>2</sup> + a<sup>2</sup>}] a = 5 mm = 0.5 cm, v = 20 cm/s At t = 0s, y = a<sup>3</sup> / (x<sup>2</sup> + a<sup>2</sup>) The graph between y and x can be plotted by taking different values of x. (left as exercise for the student) similarly, at t = 1 s, y = a<sup>3</sup> / {(x - v)<sup>2</sup> + a<sup>2</sup>} and at t = 2 s, y = a<sup>3</sup> / {(x - 2v)<sup>2</sup> + a<sup>2</sup>}
- 5. At x = 0, f(t) = a sin (t/T) Wave speed = v ⇒ λ = wavelength = vT (T = Time period) So, general equation of wave Y = A sin [(t/T) - (x/vT)] [because y = f((t/T) - (x/λ))
- 6. At t = 0,  $g(x) = A \sin(x/a)$ 
  - a)  $[M^0L^1T^0] = [L]$   $a = [M^0L^1T^0] = [L]$ b) Wave speed = v  $\therefore$  Time period, T = a/v (a = wave length =  $\lambda$ )
    - : General equation of wave
    - y = A sin  $\{(x/a) t/(a/v)\}$ = A sin  $\{(x - vt) / a\}$
- 7. At  $t = t_0$ ,  $g(x, t_0) = A \sin (x/a)$  ...(1) For a wave traveling in the positive x-direction, the general equation is given by  $y = f\left(\frac{x}{a} - \frac{t}{T}\right)$ Putting  $t = -t_0$  and comparing with equation (1), we get
  - $\Rightarrow g(x, 0) = A \sin \{(x/a) + (t_0/T)\}$

 $\Rightarrow g(x, t) = A \sin \{(x/a) + (t_0/T) - (t/T)\}$ 

As T = a/v (a = wave length, v = speed of the wave)  $\Rightarrow$  y = A sin $\left(\frac{x}{a} + \frac{t_0}{(a/v)} - \frac{t}{(a/v)}\right)$  $= A \sin \left( \frac{x + v(t_0 - t)}{a} \right)$  $\Rightarrow y = A \sin \left[ \frac{x - v(t - t_0)}{a} \right]$ The equation of the wave is given by 8. y = (0.1 mm) sin [(31.4 m<sup>-1</sup>)x + (314 s<sup>-1</sup>)t] y = r sin {( $2\pi x / \lambda$ )} +  $\omega t$ ) a) Negative x-direction b)  $k = 31.4 \text{ m}^{-1}$  $\Rightarrow 2\lambda/\lambda = 31.4 \Rightarrow \lambda = 2\pi/31.4 = 0.2$  mt = 20 cm Again,  $\omega$  = 314 s<sup>-1</sup>  $\Rightarrow 2\pi f = 314 \Rightarrow f = 314 / 2\pi = 314 / (2 \times (3/14)) = 50 \text{ sec}^{-1}$  $\therefore$  wave speed, v =  $\lambda f$  = 20  $\times$  50 = 1000 cm/s c) Max. displacement = 0.10 mm Max. velocity =  $a\omega = 0.1 \times 10^{-1} \times 314 = 3.14$  cm/sec. 9. Wave speed, v = 20 m/s A = 0.20 cm  $\lambda = 2 \text{ cm}$ a) Equation of wave along the x-axis  $y = A \sin(kx - wt)$  $\therefore k = 2\pi/\lambda = 2\pi/2 = \pi \text{ cm}^{-1}$  $T = \lambda/v = 2/2000 = 1/1000 \text{ sec} = 10^{-3} \text{ sec}$  $\Rightarrow \omega = 2\pi/T = 2\pi \times 10^{-3} \text{ sec}^{-1}$ So, the wave equation is, :.  $y = (0.2 \text{ cm})\sin[(\pi \text{ cm}^{-1})x - (2\pi \times 10^3 \text{ sec}^{-1})t]$ b) At x = 2 cm, and t = 0,  $y = (0.2 \text{ cm}) \sin (\pi/2) = 0$  $\therefore$  v = r $\omega$  cos  $\pi$ x = 0.2 × 2000  $\pi$  × cos 2 $\pi$  = 400  $\pi$  $= 400 \times (3.14) = 1256$  cm/s = 400  $\pi$  cm/s = 4 $\pi$  m/s 10. Y = (1 mm) sin  $\pi \left[ \frac{x + t}{2cm} - 0.01sec \right]$ a) T = 2 × 0.01 = 0.02 sec = 20 ms  $\lambda = 2 \times 2 = 4$  cm b)  $v = dy/dt = d/dt [\sin 2\pi (x/4 - t/0.02)] = -\cos 2\pi \{x/4) - (t/0.02)\} \times 1/(0.02)$  $\Rightarrow$  v = -50 cos 2 $\pi$  {(x/4) - (t/0.02)} at x = 1 and t = 0.01 sec,  $v = -50 \cos 2^* [(1/4) - (1/2)] = 0$ c) i) at x = 3 cm, t = 0.01 sec  $v = -50 \cos 2\pi (3/4 - \frac{1}{2}) = 0$ ii) at x = 5 cm, t = 0.01 sec, v = 0 (putting the values) iii) at x = 7 cm, t = 0.01 sec, v = 0at x = 1 cm and t = 0.011 sec  $v = -50 \cos 2\pi \{(1/4) - (0.011/0.02)\} = -50 \cos (3\pi/5) = -9.7 \text{ cm/sec}$ (similarly the other two can be calculated) 11. Time period, T =  $4 \times 5$  ms =  $20 \times 10^{-3}$  =  $2 \times 10^{-2}$  s  $\lambda = 2 \times 2 \text{ cm} = 4 \text{ cm}$ frequency,  $f = 1/T = 1/(2 \times 10^{-2}) = 50 \text{ s}^{-1} = 50 \text{ Hz}$ Wave speed =  $\lambda f = 4 \times 50 \text{ m/s} = 2000 \text{ m/s} = 2 \text{ m/s}$ 

- a) Amplitude, A = 1 mm b) Wave length,  $\lambda = 4$  cm c) wave number,  $n = 2\pi/\lambda = (2 \times 3.14)/4 = 1.57 \text{ cm}^{-1}$  (wave number = k) d) frequency,  $f = 1/T = (26/\lambda)/20 = 20/4 = 5 Hz$ (where time period T =  $\lambda/v$ ) 13. Wave speed = v = 10 m/sec Time period = T = 20 ms =  $20 \times 10^{-3} = 2 \times 10^{-2}$  sec a) wave length,  $\lambda = vT = 10 \times 2 \times 10^{-2} = 0.2 \text{ m} = 20 \text{ cm}$ b) wave length,  $\lambda = 20$  cm  $\therefore$  phase diff<sup>n</sup> =  $(2\pi/\lambda)$  x =  $(2\pi/20) \times 10 = \pi$  rad  $y_1 = a \sin(\omega t - kx) \implies 1.5 = a \sin(\omega t - kx)$ So, the displacement of the particle at a distance x = 10 cm.  $[\phi = \frac{2\pi x}{\lambda} = \frac{2\pi \times 10}{20} = \pi$ ] is given by  $y_2 = a \sin (\omega t - kx + \pi) \Rightarrow -a \sin(\omega t - kx) = -1.5 \text{ mm}$  $\therefore$  displacement = -1.5 mm 14. mass = 5 g, length I = 64 cm  $\therefore$  mass per unit length = m = 5/64 g/cm  $\therefore$  Tension, T = 8N = 8  $\times$  10<sup>5</sup> dyne V =  $\sqrt{(T/m)} = \sqrt{(8 \times 10^5 \times 64)/5} = 3200$  cm/s = 32 m/s 15. a) Velocity of the wave,  $v = \sqrt{(T/m)} = \sqrt{(16 \times 10^5)/0.4} = 2000 \text{ cm/sec}$  $\therefore$  Time taken to reach to the other end = 20/2000 = 0.01 sec Time taken to see the pulse again in the original position =  $0.01 \times 2 = 0.02$  sec b) At t = 0.01 s, there will be a 'though' at the right end as it is reflected. 16. The crest reflects as a crest here, as the wire is traveling from denser to rarer medium.  $\Rightarrow$  phase change = 0 a) To again original shape distance travelled by the wave S = 20 + 20 = 40 cm. Wave speed, v = 20 m/s  $\Rightarrow$  time = s/v = 40/20 = 2 sec b) The wave regains its shape, after traveling a periodic distance =  $2 \times 30 = 60$  cm  $\therefore$  Time period = 60/20 = 3 sec. c) Frequency,  $n = (1/3 \text{ sec}^{-1})$  $n = (1/2I) \sqrt{(T/m)}$ m = mass per unit length = 0.5 g/cm  $\Rightarrow 1/3 = 1/(2 \times 30) \sqrt{(T/0.5)}$  $\Rightarrow$  T = 400  $\times$  0.5 = 200 dyne = 2  $\times$  10<sup>-3</sup> Newton. 17. Let  $v_1$  = velocity in the 1<sup>st</sup> string  $\Rightarrow$  v<sub>1</sub> =  $\sqrt{(T/m_1)}$ Because  $m_1$  = mass per unit length = ( $\rho_1 a_1 I_1 / I_1$ ) =  $\rho_1 a_1$  where  $a_1$  = Area of cross section  $\Rightarrow$  v<sub>1</sub> =  $\sqrt{(T/\rho_1 a_1)}$  ...(1) Let  $v_2$  = velocity in the second string  $\Rightarrow$  v<sub>2</sub> =  $\sqrt{(T/m^2)}$  $\Rightarrow$  v<sub>2</sub> =  $\sqrt{(T/\rho_2 a_2)}$  ...(2) Given that,  $v_1 = 2v_2$  $\Rightarrow \sqrt{(T/\rho_1 a_1)} = 2\sqrt{(T/\rho_2 a_2)} \Rightarrow (T/a_1 \rho_1) = 4(T/a_2 \rho_2)$ 
  - $\Rightarrow \rho_1/\rho_2 = 1/4 \Rightarrow \rho_1 : \rho_2 = 1 : 4$  (because  $a_1 = a_2$ )

12. Given that, v = 200 m/s

```
18. m = mass per unit length = 1.2 \times 10^{-4} kg/mt
      Y = (0.02m) sin [(1.0 m<sup>-1</sup>)x + (30 s<sup>-1</sup>)t]
      Here, k = 1 m<sup>-1</sup> = 2\pi/\lambda
      \omega = 30 \text{ s}^{-1} = 2\pi \text{f}
      ... velocity of the wave in the stretched string
      v = \lambda f = \omega/k = 30/I = 30 \text{ m/s}
      \Rightarrow v = \sqrt{T/m} \Rightarrow 30\sqrt{(T/1.2) \times 10^{-4} N}
      \Rightarrow T = 10.8 × 10<sup>-2</sup> N \Rightarrow T = 1.08 × 10<sup>-1</sup> Newton.
19. Amplitude, A = 1 cm, Tension T = 90 N
      Frequency, f = 200/2 = 100 Hz
      Mass per unit length, m = 0.1 kg/mt
      a) \Rightarrow V = \sqrt{T/m} = 30 m/s
          \lambda = V/f = 30/100 = 0.3 \text{ m} = 30 \text{ cm}
      b) The wave equation y = (1 \text{ cm}) \cos 2\pi (t/0.01 \text{ s}) - (x/30 \text{ cm})
          [because at x = 0, displacement is maximum]
      c) y = 1 \cos 2\pi (x/30 - t/0.01)
          \Rightarrow v = dy/dt = (1/0.01)2\pi sin 2\pi {(x/30) – (t/0.01)}
          a = dv/dt = - \{4\pi^2 / (0.01)^2\} \cos 2\pi \{(x/30) - (t/0.01)\}
          When, x = 50 cm, t = 10 ms = 10 \times 10^{-3} s
          x = (2\pi / 0.01) \sin 2\pi \{(5/3) - (0.01/0.01)\}
          = (p/0.01) sin (2\pi \times 2/3) = (1/0.01) sin (4\pi/3) = -200 \pi sin (\pi/3) = -200 \pix (\sqrt{3}/2)
          = 544 \text{ cm/s} = 5.4 \text{ m/s}
          Similarly
          a = \{4\pi^2 / (0.01)^2\} \cos 2\pi \{(5/3) - 1\}
          = 4\pi^2 \times 10^4 \times \frac{1}{2} \Rightarrow 2 \times 10^5 \text{ cm/s}^2 \Rightarrow 2 \text{ km/s}^2
20. I = 40 cm, mass = 10 g
      \therefore mass per unit length, m = 10 / 40 = 1/4 (g/cm)
      spring constant K = 160 N/m
      deflection = x = 1 cm = 0.01 m
      \Rightarrow T = kx = 160 × 0.01 = 1.6 N = 16 × 10<sup>4</sup> dyne
      Again v = \sqrt{(T/m)} = \sqrt{(16 \times 10^4 / (1/4))} = 8 \times 10^2 cm/s = 800 cm/s
      ... Time taken by the pulse to reach the spring
      t = 40/800 = 1/20 = 0/05 sec.
21. m_1 = m_2 = 3.2 \text{ kg}
      mass per unit length of AB = 10 g/mt = 0.01 kg.mt
      mass per unit length of CD = 8 g/mt = 0.008 kg/mt
      for the string CD, T = 3.2 \times g
      \Rightarrow v = \sqrt{(T/m)} = \sqrt{(3.2 \times 10)/0.008} = \sqrt{(32 \times 10^3)/8} = 2 \times 10\sqrt{10} = 20 \times 3.14 = 63 m/s
      for the string AB, T = 2 \times 3.2 g = 6.4 \times g = 64 N
      \Rightarrow v = \sqrt{(T/m)} = \sqrt{(64/0.01)} = \sqrt{6400} = 80 m/s
                                                                                                                       22. Total length of string 2 + 0.25 = 2.25 mt
      Mass per unit length m = \frac{4.5 \times 10^{-3}}{2.25} = 2 × 10<sup>-3</sup> kg/m
                                                                                                                  25 cn
                                                                                                                                   2mt
      T = 2q = 20 N
      Wave speed, v = \sqrt{(T/m)} = \sqrt{20}/(2 \times 10^{-3}) = \sqrt{10^4} = 10^2 m/s = 100 m/s
      Time taken to reach the pully, t = (s/v) = 2/100 = 0.02 sec.
                                                                                                                                  `a = 2 m/s²
23. m = 19.2 \times 10^{-3} kg/m
      from the freebody diagram,
      T - 4g - 4a = 0
                                                                                                                      4 kg
      \Rightarrow T = 4(a + q) = 48 N
                                                                                                                                       4g
      wave speed, v = \sqrt{(T/m)} = 50 \text{ m/s}
                                                                                                                                     4a
```

24. Let M = mass of the heavy ball (m = mass per unit length) Wave speed,  $v_1 = \sqrt{(T/m)} = \sqrt{(Mg/m)}$  (because T = Mg)  $\Rightarrow 60 = \sqrt{(Mg/m)} \Rightarrow Mg/m = 60^2 \dots (1)$ Т From the freebody diagram (2),  $v_2 = \sqrt{(T'/m)}$ Mg (Rest)  $\Rightarrow v_2 = \frac{\left[(Ma)^2 + (Mg)^2\right]^{1/4}}{m^{1/2}} \quad (\text{because } T' = \sqrt{(Ma)^2 + (Mg)^2} \ )$  $\Rightarrow 62 = \frac{[(Ma)^2 + (Mg)^2]^{1/4}}{m^{1/2}}$  $\Rightarrow \frac{\sqrt{(Ma)^2 + (Mg)^2}}{m} = 62^2$ Ňа ...(2) Mg  $Eq(1) + Eq(2) \Rightarrow (Mg/m) \times [m / \sqrt{(Ma)^2 + (Mg)^2}] = 3600 / 3844$ (Motion)  $\Rightarrow$  g /  $\sqrt{(a^2 + g^2)}$  = 0.936  $\Rightarrow$  g<sup>2</sup> / (a<sup>2</sup> + g<sup>2</sup>) = 0.876  $\Rightarrow (a^{2} + 100) \ 0.876 = 100$  $\Rightarrow a^{2} \times 0.876 = 100 - 87.6 = 12.4$  $\Rightarrow$  a<sup>2</sup> = 12.4 / 0.876 = 14.15  $\Rightarrow$  a = 3.76 m/s<sup>2</sup>  $\therefore$  Acce<sup>n</sup> of the car = 3.7 m/s<sup>2</sup> 25. m = mass per unit length of the string R = Radius of the loop (mRd0)w<sup>2</sup>R  $\omega$  = angular velocity, V = linear velocity of the string Consider one half of the string as shown in figure. The half loop experiences cetrifugal force at every point, away from centre, which is balanced by tension 2T. Consider an element of angular part  $d\theta$  at angle  $\theta$ . Consider another element symmetric to this centrifugal force experienced by the element =  $(mRd\theta)\omega^2 R$ . (...Length of element =  $Rd\theta$ , mass =  $mRd\theta$ ) Resolving into rectangular components net force on the two symmetric elements, DF =  $2mR^2 d\theta\omega^2 \sin \theta$  [horizontal components cancels each other] So, total F =  $\int_{0}^{\pi/2} 2mR^2\omega^2 \sin\theta d\theta = 2mR^2\omega^2 [-\cos\theta] \Rightarrow 2mR^2\omega^2$ Again,  $2T = 2mR^2\omega^2 \implies T = mR^2\omega^2$ Velocity of transverse vibration V =  $\sqrt{T/m}$  =  $\omega R$  = V So, the speed of the disturbance will be V. ...... 26. a)  $m \rightarrow mass per unit of length of string$ consider an element at distance 'x' from lower end. Here wt acting down ward = (mx)g = Tension in the string of upper part Velocity of transverse vibration = v =  $\sqrt{T/m} = \sqrt{(mgx/m)} = \sqrt{(gx)}$ b) For small displacement dx, dt = dx /  $\sqrt{(gx)}$ Total time T =  $\int_{-\infty}^{L} dx / \sqrt{gx} = \sqrt{(4L/g)}$ c) Suppose after time 't' from start the pulse meet the particle at distance y from lower end.  $t = \int_{0}^{y} dx / \sqrt{gx} = \sqrt{(4y/g)}$ B  $\therefore$  Distance travelled by the particle in this time is (L - y)

 $\therefore$  S – ut + 1/2 gt<sup>2</sup>  $\Rightarrow$  L – y (1/2)g × { $\sqrt{(4y/g)^2}$ }  $\{u = 0\}$  $\Rightarrow$  L – y = 2y  $\Rightarrow$  3y = L  $\Rightarrow$  y = L/3. So, the particle meet at distance L/3 from lower end. 27.  $m_A = 1.2 \times 10^{-2}$  kg/m,  $T_A = 4.8$  N  $\Rightarrow$  V<sub>A</sub> =  $\sqrt{T/m}$  = 20 m/s  $m_B = 1.2 \times 10^{-2}$  kg/m,  $T_B = 7.5$  N  $\Rightarrow$  V<sub>B</sub> =  $\sqrt{T/m}$  = 25 m/s t = 0 in string A  $t_1 = 0 + 20 \text{ ms} = 20 \times 10^{-3} = 0.02 \text{ sec}$ In 0.02 sec A has travelled  $20 \times 0.02 = 0.4$  mt Relative speed between A and B = 25 - 20 = 5 m/s Time taken for B for overtake A = s/v = 0.4/5 = 0.08 sec 28. r = 0.5 mm =  $0.5 \times 10^{-3}$  mt f = 100 Hz. T = 100 N v = 100 m/s  $v = \sqrt{T/m} \Rightarrow v^2 = (T/m) \Rightarrow m = (T/v^2) = 0.01 \text{ kg/m}$  $P_{ave} = 2\pi^2 mvr^2 f^2$ =  $2(3.14)^{2}(0.01) \times 100 \times (0.5 \times 10^{-3})^{2} \times (100)^{2} \Rightarrow 49 \times 10^{-3}$  watt = 49 mW 29. A = 1 mm =  $10^{-3}$  m, m = 6 g/m =  $6 \times 10^{-3}$  kg/m T = 60 N, f = 200 Hz  $\therefore$  V =  $\sqrt{T/m}$  = 100 m/s a)  $P_{average} = 2\pi^2 \text{ mv } A^2 f^2 = 0.47 \text{ W}$ b) Length of the string is 2 m. So, t = 2/100 = 0.02 sec Energy =  $2\pi^2 \text{ mvf}^2 \text{A}^2 \text{t}$  = 9.46 mJ. 30. f = 440 Hz, m = 0.01 kg/m, T = 49 N, r =  $0.5 \times 10^{-3}$  m a)  $v = \sqrt{T/m} = 70 \text{ m/s}$ b)  $v = \lambda f \Rightarrow \lambda = v/f = 16 \text{ cm}$ c)  $P_{average} = 2\pi^2 \text{ mvr}^2 f^2 = 0.67 \text{ W}.$ 31. Phase difference  $\phi = \pi/2$ f and  $\lambda$  are same. So,  $\omega$  is same.  $y_1 = r \sin wt$ ,  $y_2 = r \sin(wt + \pi/2)$ From the principle of superposition = r sin wt + r sin (wt +  $\pi/2$ )  $y = y_1 + y_2$  $\rightarrow$ = r[sin wt + sin(wt +  $\pi/2$ )]  $= r[2sin{(wt + wt + \pi/2)/2} cos {(wt - wt - \pi/2)/2}]$  $\Rightarrow$  y = 2r sin (wt +  $\pi/4$ ) cos ( $-\pi/4$ ) Resultant amplitude =  $\sqrt{2}$  r = 4 $\sqrt{2}$  mm (because r = 4 mm) 32. The distance travelled by the pulses are shown below.  $s = vt = 50 \times 10 \times 4 \times 10^{-3} = 2 mm$  $t = 4 \text{ ms} = 4 \times 10^{-3} \text{ s}$  $t = 8 \text{ ms} = 8 \times 10^{-3} \text{ s}$  $s = vt = 50 \times 10 \times 8 \times 10^{-3} = 4 mm$  $t = 6 \text{ ms} = 6 \times 10^{-3} \text{ s}$ s = 3 mm t = 12 ms =  $12 \times 10^{-3}$  s  $s = 50 \times 10 \times 12 \times 10^{-3} = 6 \text{ mm}$ The shape of the string at different times are shown in the figure. 33. f = 100 Hz,  $\lambda$  = 2 cm = 2 × 10<sup>-2</sup> m  $\therefore$  wave speed, v = f $\lambda$  = 2 m/s a) in 0.015 sec 1<sup>st</sup> wave has travelled  $x = 0.015 \times 2 = 0.03 \text{ m} = \text{path diff}^n$ :. corresponding phase difference,  $\phi = 2\pi x/\lambda = \{2\pi / (2 \times 10^{-2})\} \times 0.03 = 3\pi$ . b) Path different x = 4 cm = 0.04 m

 $\Rightarrow \phi = (2\pi/\lambda) \mathbf{x} = \{(2\pi/2 \times 10^{-2}) \times 0.04\} = 4\pi.$ c) The waves have same frequency, same wavelength and same amplitude. Let,  $y_1 = r \sin wt$ ,  $y_2 = r \sin (wt + \phi)$  $\Rightarrow$  y = y<sub>1</sub> + y<sub>2</sub> = r[sin wt + (wt +  $\phi$ )] =  $2r \sin(wt + \phi/2) \cos(\phi/2)$  $\therefore$  resultant amplitude = 2r cos  $\phi/2$ So, when  $\phi = 3\pi$ , r = 2 × 10<sup>-3</sup> m  $R_{res} = 2 \times (2 \times 10^{-3}) \cos (3\pi/2) = 0$ Again, when  $\phi = 4\pi$ ,  $R_{res} = 2 \times (2 \times 10^{-3}) \cos (4\pi/2) = 4$  mm. 34. I = 1 m, V = 60 m/s  $\therefore$  fundamental frequency,  $f_0 = V/2I = 30 \text{ sec}^{-1} = 30 \text{ Hz}.$ 35. I = 2m, f<sub>0</sub> = 100 Hz, T = 160 N  $f_0 = 1/2I_{\sqrt{(T/m)}}$  $\Rightarrow$  m = 1 g/m. So, the linear mass density is 1 g/m. 36. m = (4/80) g/cm = 0.005 kg/mT = 50 N, I = 80 cm = 0.8 m  $v = \sqrt{(T/m)} = 100 \text{ m/s}$ fundamental frequency  $f_0 = 1/2I_{\sqrt{(T/m)}} = 62.5 \text{ Hz}$ First harmonic = 62.5 Hz  $f_4$  = frequency of fourth harmonic =  $4f_0$  =  $F_3$  = 250 Hz  $V = f_4 \lambda_4 \Rightarrow \lambda_4 = (v/f_4) = 40$  cm. 37. I = 90 cm = 0.9 m m = (6/90) g/cm = (6/900) kg/mt f = 261.63 Hz  $f = 1/2I\sqrt{(T/m)} \Rightarrow T = 1478.52 N = 1480 N.$ 38. First harmonic be f<sub>0</sub>, second harmonic be f<sub>1</sub> ∴ f<sub>1</sub> = 2f<sub>0</sub>  $\Rightarrow$  f<sub>0</sub> = f<sub>1</sub>/2  $f_1 = 256 \text{ Hz}$ ... 1<sup>st</sup> harmonic or fundamental frequency  $f_0 = f_1/2 = 256 / 2 = 128 Hz$  $\lambda/2 = 1.5 \text{ m} \Rightarrow \lambda = 3 \text{m}$  (when fundamental wave is produced)  $\Rightarrow$  Wave speed = V = f<sub>0</sub>QI = 384 m/s. 39. I = 1.5 m, mass – 12 g  $\Rightarrow$  m = 12/1.5 g/m = 8 × 10<sup>-3</sup> kg/m  $T = 9 \times q = 90 N$  $\lambda = 1.5 \text{ m}, f_1 = 2/2 \sqrt{T/m}$ [for, second harmonic two loops are produced]  $f_1 = 2f_0 \Rightarrow 70$  Hz. 40. A string of mass 40 g is attached to the tuning fork  $m = (40 \times 10^{-3}) \text{ kg/m}$ The fork vibrates with f = 128 Hz  $\lambda = 0.5 \text{ m}$  $v = f\lambda = 128 \times 0.5 = 64$  m/s  $v = \sqrt{T/m} \Rightarrow T = v^2 m = 163.84 N \Rightarrow 164 N.$ 41. This wire makes a resonant frequency of 240 Hz and 320 Hz. The fundamental frequency of the wire must be divisible by both 240 Hz and 320 Hz. a) So, the maximum value of fundamental frequency is 80 Hz. b) Wave speed, v = 40 m/s

 $\Rightarrow$  80 = (1/2l)  $\times$  40  $\Rightarrow$  0.25 m.

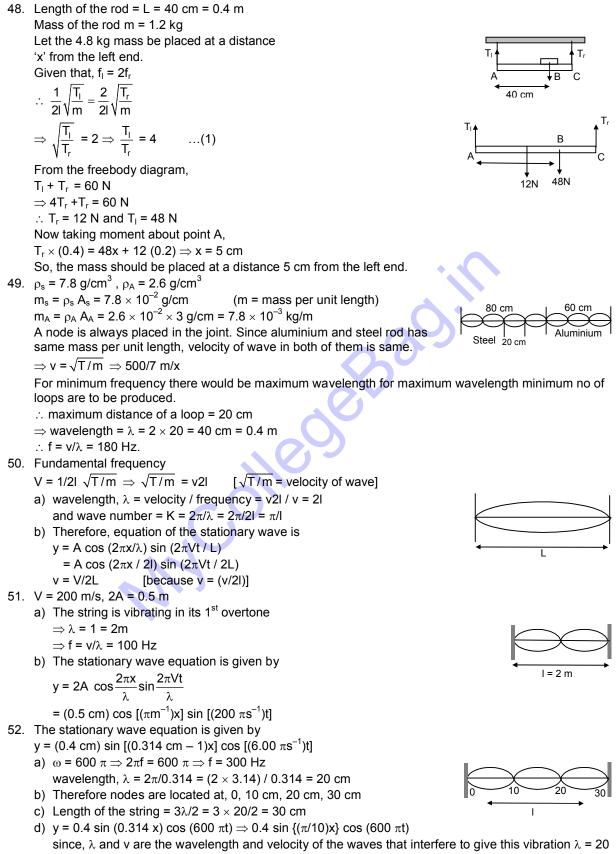

Chapter 15

 $v = \omega/k = 6000 \text{ cm/sec} = 60 \text{ m/s}$ 53. The equation of the standing wave is given by y = (0.4 cm) sin [(0.314 cm<sup>-1</sup>)x] cos [(6.00  $\pi$ s<sup>-1</sup>)t]  $\Rightarrow$  k = 0.314 =  $\pi/10$  $\Rightarrow 2\pi/\lambda = \pi/10 \Rightarrow \lambda = 20 \text{ cm}$ for smallest length of the string, as wavelength remains constant, the string should vibrate in fundamental frequency  $\Rightarrow$  I =  $\lambda/2$  = 20 cm / 2 = 10 cm 54. L = 40 cm = 0.4 m, mass =  $3.2 \text{ kg} = 3.2 \times 10^{-3} \text{ kg}$  $\therefore$  mass per unit length, m = (3.2)/(0.4) = 8 × 10<sup>-3</sup> kg/m string change in length,  $\Delta L = 40.05 - 40 = 0.05 \times 10^{-2}$  m strain =  $\Delta L/L$  = 0.125 × 10<sup>-2</sup> m f = 220 Hz  $f = \frac{1}{2l'}\sqrt{\frac{T}{m}} = \frac{1}{2 \times (0.4005)}\sqrt{\frac{T}{8 \times 10^{-3}}} \Rightarrow T = 248.19 \text{ N}$ Strain =  $248.19/1 \text{ mm}^2$  =  $248.19 \times 10^6$ Y = stress / strain =  $1.985 \times 10^{11}$  N/m<sup>2</sup> 55. Let,  $\rho \rightarrow$  density of the block Weight  $\rho$  Vg where V = volume of block The same turning fork resonates with the string in the two cases  $f_{10} = \frac{10}{2l} \sqrt{\frac{T - \rho_w Vg}{m}} = \frac{11}{2l} \sqrt{\frac{(\rho - \rho_w) Vg}{m}}$ As the f of tuning fork is same,  $f_{10} = f_{11} \Rightarrow \frac{10}{2l} \sqrt{\frac{\rho Vg}{m}} = \frac{11}{2l} \sqrt{\frac{(\rho - \rho_w) Vg}{m}}$  $\Rightarrow \frac{10}{11} = \sqrt{\frac{\rho - \rho_w}{m}} \Rightarrow \frac{\rho - 1}{\rho} = \frac{100}{121}$ (because,  $\rho_w = 1 \text{ gm/cc}$ )  $\Rightarrow$  100 $\rho$  = 121  $\rho$  – 121  $\Rightarrow$  5.8  $\times$  10<sup>3</sup> kg/m<sup>3</sup> 56. I = length of rope = 2 mM = mass = 80 gm = 0.8 kg mass per unit length = m = 0.08/2 = 0.04 kg/m Tension T = 256 N  $I = \lambda/4$ Velocity, V =  $\sqrt{T/m}$  = 80 m/s Initial position For fundamental frequency,  $I = \lambda/4 \Rightarrow \lambda = 4I = 8 m$ ⇒ f = 80/8 = 10 Hz a) Therefore, the frequency of 1<sup>st</sup> two overtones are  $1^{st}$  overtone = 3f = 30 Hz  $2^{nd}$  overtone = 5f = 50 Hz b)  $\lambda_1 = 4I = 8 m$ Final position  $\lambda_1 = V/f_1 = 2.67 m$  $\lambda_2 = V/f_2 = 1.6 \text{ mt}$ so, the wavelengths are 8 m, 2.67 m and 1.6 m respectively. 57. Initially because the end A is free, an antinode will be formed. So,  $I = QI_1 / 4$ 

Again, if the movable support is pushed to right by 10 m, so that the joint is placed on the pulley, a node will be formed there.

So, I =  $\lambda_2$  / 2

Since, the tension remains same in both the cases, velocity remains same.

As the wavelength is reduced by half, the frequency will become twice as that of 120 Hz i.e. 240 Hz.
